Stylish TRANQUILITY

Sound easily bounces between hard surfaces and parallel walls. Human voices, HVAC systems, and electronic equipment all contribute to the undercurrent of "flutter echo" as sounds bounce and rebound from one surface to another.

HUSH™ Acoustical Panels from Compatico are the easy, attractive, economical, and efficient way to reduce distracting noise and reverb from your office environment.

HUSH™ Acoustical wall panels are made from 85% recycled cellulose, which outperforms the acoustical characteristics of fiberglass. Covered with your choice of acoustically-absorbant fabric, HUSH™ Acoustic panel is engineered for active environments to absorb and diffuse unwanted sounds and improve productivity. HUSH™ Acoustical Tiles have an average NRC rating of 0.70, considered the sweet spot for an ideal acoustical environment.

Contains NO fiberglass; 100% recyclable.

Class A Fire Rating on core material (flames spread at 15-25; under 450 smoke; ASTM E84; UL 723). Check manufacturer's specs for fabric fire rating.

Absorbs and scatters sounds for maximum noise reduction.

Reduces cross-talk interference making it easier to understand conversations.

Reduces flutter echo for podcast and video recordings.

Available in thousands of fabric coverings.

Easy to install using 3M Dual Lock, high tack double sided tape, or permanent spray adhesive. No wall penetrating clips or brackets.

Fundamental ACOUSTICS

In Wall And Room Structures

The acoustic sound panels are a major factor in modern construction decisions and one of the least understood areas. Poor acoustics can ruin an otherwise beautiful installation.

SOUND

Sound is an oscillating wave of pressure which can travel through solids, liquids, and gases and is within a frequency range and of sufficient power level to be perceived by the ear. Shaping, and sometimes containing sounds can improve the experience of a modern office ecosystem.

This acoustical wall panels discussions in office environments generally focus on four primary terms:

REFLECTION

The condition where sound bounces off a surface or multiple surfaces before reaching the receiver.

STC

Sound Transmission Class Number rating of a wall or structure's ability to block the transfer of sound.

REVERBERATION

The continued reflections of sound within an enclosed space after the sound source has stopped. Long delays are called discreet echoes.

NRC

Noise Reduction Coefficient Number rating which categorizes the sound absorptive or reflective properties of a material or surface.

Tame AMBIENT NOISE

NOISE REDUCTION COEFFICIENT

Number rating that categorizes the absorptive or reflective properties of an environment.

A perfectly reflective environment would have a rating of 0.0 NRC. Productivity generally suffers in low NRC environments as the acoustics make concentration or conversations difficult.

A perfectly absorbent environment would have a 1.0 NRC and would sound acoustically "dead" without any reflections or reverberation. While 1.0 NRC environments are rare in the real world, very high NRC environments can also be distracting in that they feel confining or claustrophobic.

Generally speaking people prefer an environment that is between .5-.8 NRC. This is the range where reverberations are minimal, yet the surroundings still feel open and pleasant.

GENERAL NRC RATINGS FOR COMPARISON

Brick .00-.03

Wood .05-.15

Heavy Carpet .30-.55

18oz Drapery .60-.65

HUSH™ Tiles .70-.75

Recording Studio Foam Blocks .80-.90+

BOOST YOUR CURRENT ENVIRONMENT

Most people don't prefer a totally absorbent room; a little reverberation is a good thing. It is the audible equivalent of having an office with a window. Studies have shown that a person in an acoustically controlled environment is generally happier and more productive.

Most office environments with painted gypsum walls, commercial carpeting, and dropped ceiling tiles measure around .27-.35 NRC. These environments do not need expensive engineered solutions, they just need a boost. HUSH™ Tiles are the perfect solution to bring an environment up to the sweet spot of .50-.80 NRC.

Applying Hush™ Acoustic Tiles to as little as 20% of wall surface can have a dramatic effect in controlling excess reverberations. Though all environments are different, improvements as high 50% are common.

PRE-PACKAGED TILE CONFIGURATIONS

Choose from the following pre-packaged tile configurations or customize it!

Thickness: .25" .75" 1.25"

Tile Sizes: 15" 30" 75" 15" 30" 30" 30"

Wall Space: 45" x 30"
